```

Using the **netstat an** command in Windows Powershell will allow me to see all connections and ports that the machine is listening on. We can also see the foreign addresses connected to the machine.

We have various states which describe what every port is doing.

ESTABLISHED: An active connection that is open.

LISTENING: Machine is awaiting a connection to that port.

TIME_WAIT: Port connection is closed.

For our listening port we have

Port 135 – which is our Windows Service Port

Port 445 – which is the Windows File Sharing used for network drives

Port 5040 – Windows Security Service that runs in the background as a service

Port 49664 – 49674 Windows Dynamic RPC ports that open on windows automatically

Port 55940 – Localhost only

Port 443 – Handles everything http, meaning all port connections on this port are encrypted
